
Kubernetes Training Handout — Platform Basics

What you will learn

This half-day session covers how our EKS clusters are organized, how a deploy actually reaches production, and what to check first when a pod misbehaves. It pairs with the [kubernetes conventions doc](#) and the [deploy guide](#).

Cluster layout

- Namespaces per team, quotas from the capacity planning review.
- Autoscaling groups back three node pools: general, memory-heavy, and spot.
- Ingress flows CDN → load balancer → gateway; NetworkPolicies default-deny.

Deploy path

Merge to main → GitHub Actions builds and signs the image → canary deployment ships 5% for 20 minutes with automated rollback on SLO burn → full rollout. Rollback strategies are one command; practice it in staging today.

Debugging drill

CrashLoopBackOff exercise: read events, check resource limits, pull logs, compare with Grafana dashboards, and decide rollback vs. fix-forward using the incident severity guide.
