

Customer Incident Report — April 8, 2026 Search Degradation

Summary

Between 14:20 and 16:05 UTC on April 8, 2026, search queries returned elevated errors (peak 6% of requests). Core platform, billing, and data ingestion were unaffected. No data was lost.

What happened

A scheduled Elasticsearch indexing job coincided with an unusually large tenant import, saturating the hot tier. Circuit breakers shed search load as designed; the oncall rotation was paged within four minutes and mitigated by pausing the import and scaling the hot tier.

What we are changing

- Import jobs now reserve indexing capacity and run outside peak windows.
- Hot-tier autoscaling triggers on queue depth, not only CPU.
- Search SLO dashboards are public to customers on the status page.

We apologize for the disruption. Questions: support@nebulasystems.example.
