

Architecture All-Hands

Engineering · how the platform fits together in 2026

The big picture

Edge: CDN caching in front of the load balancer and WAF rules

Core: auth service, billing, search, and the API gateway

Async: Kafka event bus connects producers to the analytics sinks

Data: Postgres for transactions, Redis cache, S3 storage for blobs

What changed this year

SSO via Okta replaced the legacy session service

Schema migrations moved to online, backwards-compatible only

Neo4j graph database powers the new entitlements explorer

Elasticsearch indexing rebuilt with zero-downtime aliases

Operational posture

Autoscaling groups sized from the Datadog tracing p99s

Database backups verified weekly by automated restore

Secrets management centralized in Vault with 90-day rotation

DNS management and NAT gateway configs are Terraform modules

Where we're heading

Multi-region reads behind the CDN by Q4

Postgres replication lag SLO of under two seconds

Tenant isolation hardening for the enterprise tier
