

CAPACITY PLANNING NOTES — 2026 mid-year review

Compute: autoscaling groups peak at 62% of reserved capacity. Headroom OK through Q4 assuming the enterprise launch adds <20% traffic. Load balancer connection counts trend +11% QoQ.

Data stores:

- Postgres primary at 58% storage; connection pooling keeps active conns flat.
- Redis cache hit rate 97.2%; memory 71% — plan a shard split before Q4.
- Elasticsearch indexing volume doubled after the analytics rollout; hot tier needs two more nodes (cloud cost analysis has the pricing).
- S3 storage growth is linear; lifecycle rules from data archiving keep costs flat.

Events: Kafka event bus at 40k msg/s peak, partitions balanced after the rebalance. ClickHouse analytics ingest lags under 30s at p99.

Action: revisit after the quarterly business review; tie increases to the usage billing forecast.
