

Disaster Recovery Plan

Objectives

RPO of five minutes for transactional data, RTO of one hour for the core platform. Postgres replication streams to the secondary region continuously; S3 storage replicates cross-region with versioning.

Scenarios

Region loss: DNS management fails over via health-checked records; autoscaling groups warm in the secondary region within 20 minutes. Data corruption: restore from verified database backups, replaying the Kafka event bus from the last checkpoint. Credential compromise: secrets management rotation runbook, all sessions revoked through SSO.

Verification

Backup verification restores run weekly and are audited for SOC 2. A full regional failover game day runs twice a year with the incident runbook; results feed the post-mortem guide and this plan.
