

LOAD TEST RESULTS — pre-launch, June 26, 2026

Scenario: enterprise launch traffic model, 2.5x current peak for 45 minutes.

Rig: k6 from three regions, production-mirror environment.

Results:

- API gateway: p50 34ms, p99 210ms (budget 250ms) PASS
- Auth service: p99 88ms; token cache hit 99.1% PASS
- Billing writes: invoice processing queue peaked at 4.2k, drained in 3m PASS
- Search: p99 480ms (budget 400ms) FAIL — Elasticsearch hot tier CPU-bound;
fix: two more hot nodes + query rewrite (ticket SEARCH-2214)
- Kafka event bus: max consumer lag 11s during the spike, recovered in 90s
- Postgres: max replication lag 2.1s; connection pooling held at 92% util

Errors: 0.02% 5xx overall; all from the search timeout path with correct rate limiting headers.

Verdict: launch-ready except search; re-test after SEARCH-2214.
