

ONCALL HANDOFF — week of June 22, 2026

Pages this week: 6 (2 actionable, 4 noise)

- Kafka event bus consumer lag alert fired twice during the EKS upgrade window.
Mitigation: paused the ClickHouse analytics sink, drained, resumed. Watch this.
- Postgres replication lag spiked to 8s during the Saturday vacuum window.
Autovacuum settings tuned per postgres-operations doc; verify next weekend.

Noise to fix:

- WAF rules alert threshold too low after the ruleset expansion. Ticket filed.
- Grafana dashboards for the NAT gateway still point at the old region.

Handing over: promo code engine launch is behind a feature flag; if billing alerts fire, flip promo-engine-v2 off first and page the billing oncall.

Escalation: PagerDuty schedule 'platform-primary', then the incident runbook.
