

Platform Team Offsite — Summary Notes

Overview

The platform team offsite reviewed team topologies, the product roadmap for the next two quarters, and friction in the RFC process. Twenty-two engineers attended across four workstreams.

Decisions

Adopt stream-aligned teams for billing and search, with a platform enabling team owning developer experience. The monorepo config stays; build caching investment continues after the 40% CI time reduction this quarter.

The RFC process gains a 'fast-track' lane for changes under two days of work, cutting review latency. Tech spec templates move into the developer handbook.

Roadmap Highlights

Q3 focuses on usage billing accuracy, Stripe webhooks reliability, and feature flags for the new customer onboarding flow. Q4 tackles internationalization and web performance budgets.

Action Items

Publish the updated team topologies chart, schedule agile sprint cycle training for new leads, and pilot the fast-track RFC lane with the deploy guide refresh.
