
GDPR Data Protection Impact Assessment — Analytics Pipeline

Processing description

The product analytics pipeline streams usage events through the Kafka event bus into ClickHouse for aggregate reporting. Events carry pseudonymous user identifiers; direct identifiers are stripped at ingestion per the data classification standard.

Necessity and proportionality

Aggregate usage metrics are necessary for capacity planning and product decisions. Retention follows the data retention policy: 13 months for raw events, indefinitely for aggregates. Erasure requests propagate within 30 days, verified quarterly.

Risks and mitigations

- Re-identification from rare event combinations — mitigated by k-anonymity thresholds on exports.
- Subprocessor access (ClickHouse Cloud) — mitigated by private-link networking, SSO-only access, and the vendor security review.
- Cross-border transfer — covered by SCCs; tenant isolation keeps EU enterprise data in-region.

Outcome

Residual risk assessed LOW. Approved by the DPO with an annual review tied to the SOC 2 cycle.
